

STAY AHEAD OF FUSARIUM

Fusarium head blight (FHB) can produce the harmful mycotoxin DON and limit your crop's end use and marketability.

Protect your investment and keep marketing options open by taking a proactive approach to FHB management.

Learn how steps like early scouting and a well-timed fungicide application can help you stay ahead of FHB at keepingitclean.ca/cereals/fusarium

Fungicide may be applied at early flowering if risk of infection is high.

Follow Keep it Clean on Twitter for the latest updates.
