

Protect the marketability of your crop. Use the **Keep It Clean**

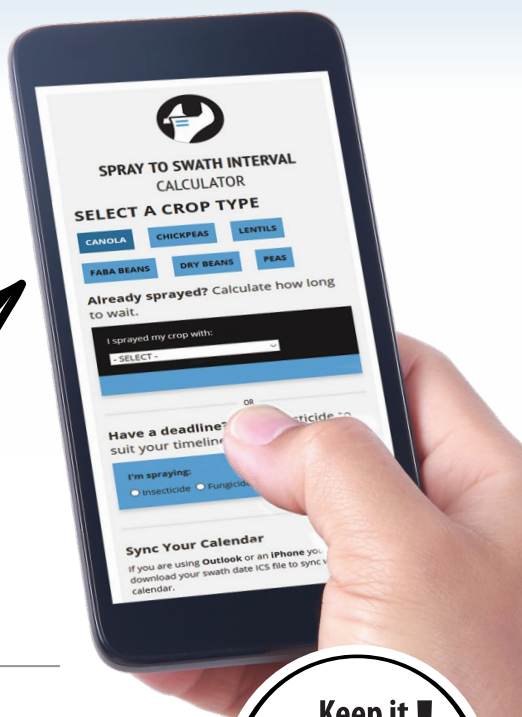

Spray to Swath Interval Calculator

Cutting the crop too soon after spraying can result in unacceptable residue on the harvested grain.

Always stick to the product's pre-harvest interval (PHI).

What's my PHI?

Simply enter your crop type and the pesticide you plan to spray – the calculator will show you the PHI for that product.

Try the calculator at spraytoswath.ca
